AI 2026 FINAL APPLIED AI PROJECT

NailsByHuntrr AI Business Dashboard

A split comparison of two paid AI development agents used to build the same business idea: Codex + Streamlit vs Google AI Studio Pro.

Hunter Bloom | Applied AI | Project: AI-assisted app development for an Etsy nail/keychain business

Live App QR

Problem

Business information was scattered across Etsy records, screenshots, nail color swatches, print files, inventory notes, and production timing. This made it harder to see what needed restocking, what orders were active, and how product development was moving.

Goal

Build a dashboard/app that combines order tracking, inventory, color data, analytics, customer review planning, and 3D printer status into one tool for data-driven business decisions.

Evaluation

I compared the AI agents by code stack, speed, pricing, debugging, transparency, visual quality, usability, demo readiness, and whether I would actually use the final tool.

AI AGENT 1

Codex + Streamlit Prototype

Python-based prototype focused on data organization and dashboard logic.

ChatGPT

Role in the Project

First version of the NailsByHuntrr dashboard.
Used to test the original idea before the final app build.
Organized business concepts into dashboard sections.
Helped prove the project workflow was possible.

Python / Streamlit Code Differences

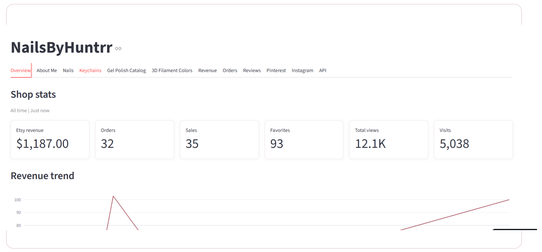

Python was stronger for data handling, simple dashboards, and chart logic.
Streamlit made quick pages, tables, filters, and analytics easier to prototype.
Code felt more backend/data focused than app-like.
Setup and debugging were more technical than the final app version.

What I Liked About Codex

It explains what it is doing while working.
It shows commands, edited files, syntax checks, and deployment steps.
It can change files directly on my computer/project folder.
This made the coding process feel more transparent.

Limitations

The final Streamlit version looked more like a dashboard prototype.
It was useful for data, but less polished for a live business app demo.
A mobile/app-like user experience required more design work.
I planned to speed through this demo because it was the starting version.

Streamlit Demo Plan

Show the homepage, order/inventory sections, and explain that this version proved the data-dashboard concept. Keep this demo short because the Google app became the version I preferred.

Evidence
Codex Session ID: 019f3f7a-9d49-78c0-9b58-3a435faa736b

Best Use
Coding help, debugging, working through files, and building the first Python prototype.

Main Takeaway
Codex was strongest during the prototype and coding stage because it made the development process visible.

Manual scores: speed / design	3.8 / 3.2
Manual scores: debugging / final fit	4.7 / 3.5

AI AGENT 2

Google AI Studio Pro App

React + TypeScript final app focused on usability, branding, and deployment.

Google AI Studio

Role in the Project

Second version became the final app I liked and would actually use.
Converted the project from dashboard prototype into app-style experience.
Added stronger visual design, navigation, and branded UI.
Better fit for live demo and real business workflow.

JavaScript / React Code Differences

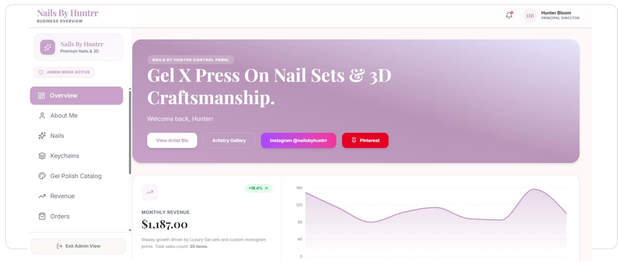

React + TypeScript used separate component files and interactive tabs.
Better for frontend design, mobile feel, and app-style user experience.
Used UI components for dashboard, orders, colors, analytics, reviews, and Bambu status.
Less direct backend/data control than Python, but better final presentation.

Speed + Upgrade Reflection

Started with the free Google AI option, but it was too slow for the deadline.
Upgraded to Google AI Pro: $4.99 for 3 months, then $19.99/month.
Switched to the latest Pro model instead of Gemini Flash 3.5.
After upgrading, feature requests and app edits felt much faster.

Debugging Challenge

Sometimes a prompt looked finished, but errors appeared after the app refreshed.
Example: React/runtime errors required the agent to go back into code and fix variables or components.
Error-fix cycles usually took longer than simple design or feature requests.
This showed that AI app builders still need testing and human review.

Google App Demo Plan

Spend most of the live demo here. Show the dashboard tabs, order/product views, color and review areas, Bambu printer status, and the deployed Cloud Run app link/QR code.

Evidence
Live app: huntrr-dashboard-607549261991.us-east1.run.app | AI Studio App ID: 0742ceed-95b8-4e70-8f60-072837437992

Best Use
Building polished UI, app navigation, branded design, and demo-ready deployment.

Main Takeaway
Google AI Studio Pro was my preferred final tool because it created a more usable and app-like product.

Manual scores: speed / design	5.0 / 5.0
Manual scores: debugging / final fit	3.8 / 5.0

Overall Results and Business Impact

Codex was better for transparent code edits and Python prototyping. Google AI Studio Pro was better for a polished app experience, visual design, and final live demo. Together, they helped move the project from idea → prototype → deployed business app.

The final app supports smarter business planning by connecting orders, inventory, nail color data, product development, reviews, analytics, and printer status into one workflow.

Category	Codex + Streamlit	Google AI Studio Pro
Language	Python	JavaScript / TypeScript
Best strength	Coding + data prototype	Visual app + deployment
Speed	Good, but setup-heavy	Fast after Pro upgrade
Errors	Helpful debugging	Fix cycles after prompts
Final choice	Useful prototype	Preferred final app

Future Improvements

Connect live Etsy API import, automate email reports, improve Bambu printer data security, add ML predictions for restocking/profit, and test an open-source model baseline for comparison.
